AI-Enabled Healthcare Recruitment Project Portfolio

International Clinical Sourcing | Recruitment Intelligence
Evidence-Based Assessment | Shortlist Delivery

HumanEvoX combines international recruitment experience with customised LLM workflows to help healthcare organisations identify, evaluate and engage suitable clinical talent. Our focus is specialty alignment, clinical evidence, credential status, candidate interest and mobilisation readiness.

The delivery model

Support agreed doctor and nurse requisitions alongside Health Co's existing recruitment systems. Deliver recruiter-reviewed CVs, candidate scorecards, outstanding credential questions, confirmed interest and availability, and targeted interview probes through an agreed submission format.

Our differentiation

Recruitment judgement directs the AI workflow. Mandatory requirements are assessed separately from comparative fit; evidence remains visible; recruiters approve submissions. The service adds sourcing and evaluation capacity without requiring system integration.

Portfolio basis

Projects 1-8 comprise the HumanEvoX workflow and portfolio designs with healthcare applications. Projects 9-11 reflect documented [redacted] experience followed by proposed AI enhancements. Named tools describe relevant design architectures and do not imply that every platform was deployed. Performance measures are evaluation criteria unless identified as documented scope or results.

A practical first engagement

A bounded doctor-and-nurse sourcing and shortlisting assignment, with agreed evaluation criteria, submission standards and review cadence. Assess candidate quality, recruiter effort and time to accepted shortlist before expanding the scope.

01 HumanEvoX LLM-Assisted Recruitment & Shortlist Intelligence Workflow

Client industry / country
HumanEvoX internal development, UAE; proposed healthcare application in KSA and UAE.

Client pain point / scope
Fragmented requisitions, CVs and interview notes create repeated work and inconsistent shortlists. Scope connects sourcing, screening, interview support, assessment and reporting.

Our methodology
Translate the brief into mandatory criteria and evidence standards. Use an LLM to draft searches, extract CV evidence, flag gaps and prepare interview questions. Standardise comparisons and draft reports through reusable prompts. Recruiters validate outputs and separately review clinical fit, credential status and mobilisation readiness. Approved future automation can route intake, review tasks and report assembly.

Technology leveraged / design stack
Customised LLM workflow; ChatGPT / Custom GPT as a potential environment; Excel scorecards; Word/PDF candidate packs. Power Automate or Make for proposed orchestration; actual model and automation configuration remain to be confirmed.

Results / performance measures
Five recruitment functions covered. Evaluate recruiter minutes per candidate, factual corrections, time to accepted shortlist and hiring-manager acceptance; measured gains are not yet established.

Differentiation for Health Co
Recruiter-approved CVs and evidence summaries delivered alongside the existing recruitment system, without requiring integration.

02 AI-Assisted International Clinical Talent Mapping & Sourcing

Client industry / country
Gulf healthcare sourcing case study; proposed application to KSA government hospitals and UAE providers.

Client pain point / scope
International searches generate volume without establishing specialty fit, candidate interest or relocation feasibility.

Our methodology
Segment demand by profession, specialty, seniority and care environment. Use LLM research to expand clinical terminology and Boolean searches. Verify profiles manually, consolidate research with Power Query and flag duplicates. Separate identified, contacted, interested and qualified candidates. Use recruiter feedback to refine searches; proposed automation routes follow-up and profile-refresh tasks.

Technology leveraged / design stack
ChatGPT or Microsoft Copilot; LinkedIn Recruiter; Excel and Power Query. LinkedIn Talent Insights, SeekOut or hireEZ are optional, subject to access and market coverage. Power Automate supports proposed task routing.

Results / performance measures
Existing design includes a market map, employer list, search strings, scorecard and pipeline template. Track qualified profiles per sourcing hour, response rate, interested-and-qualified conversion and first-shortlist turnaround.

Differentiation for Health Co
Specialty-led market coverage with a clear distinction between mapped talent and candidates genuinely available for consideration.

03 AI-Assisted Clinical CV Screening & Evidence-Based Shortlisting

Client industry / country
UAE screening demonstration; healthcare adaptation for KSA and UAE.

Client pain point / scope
Inconsistent CV terminology makes manual comparison slow and can obscure the depth of clinical experience.

Our methodology
Separate mandatory checks from weighted comparison. Use an LLM to extract qualifications, specialty history, clinical settings, employment dates and stated registration. Link assessments to CV evidence. Spreadsheet rules flag missing fields and date inconsistencies; structured outputs generate comparison tables and clarification questions. Recruiters review uncertain cases and approve progression. Missing information remains an open question.

Technology leveraged / design stack
ChatGPT or Claude; Excel validation rules and scorecards; Power Query. Microsoft AI Builder OCR for scanned documents and Power Automate for processing are proposed options in an approved environment.

Results / performance measures
Original design scope: 100 applications, not a completed clinical processing result. Evaluate extraction accuracy, reviewer agreement, false exclusions, screening time and shortlist acceptance.

Differentiation for Health Co
Each recommendation shows supporting evidence, unresolved gaps and the reason for progression to the next recruitment stage.

04 AI-Assisted Structured Interviews & Clinical Assessment Framework

Client industry / country
Recruitment and assessment portfolio frameworks; healthcare adaptation for KSA and UAE.

Client pain point / scope
Inconsistent interviews reduce comparability and consume clinical-panel time before basic suitability is established.

Our methodology
Define role competencies and observable evidence. Use an LLM to draft interview questions, probes and scoring anchors for review. Create distinct nursing, specialist and consultant guides. AI organises authorised notes against the rubric; automation collates scorecards and flags unanswered criteria. Recruiters assess employment fit and motivation; clinical specialists assess competence. Calibrate assessors and retain their individual judgement.

Technology leveraged / design stack
ChatGPT or Claude; Microsoft Forms; Excel. Authorised Microsoft Teams transcription can support notes; Power Automate can route and consolidate scorecards.

Results / performance measures
Existing outputs include interview guides, competency rubrics and reusable scorecards. Track completion, assessor agreement, preparation time, unanswered criteria and clinical-panel acceptance.

Differentiation for Health Co
Clinical interviewers receive focused evidence and targeted questions, preserving their time for specialist judgement.

05 AI-Assisted Credential Documentation & Mobilisation Readiness

Client industry / country
New healthcare project design for KSA; separate UAE configuration proposed.

Client pain point / scope
Incomplete documents and unresolved relocation requirements create late-stage recruitment delays.

Our methodology
Agree profession-specific checklists with credentialing specialists. Use OCR and an LLM to organise qualifications, experience letters and registration records. Rules flag missing fields, inconsistent dates and expiry dates. Proposed automation updates checklists, sends reminders and routes exceptions. Separate candidate-provided, recruiter-reviewed and externally verified information. Assign an owner and next action to each outstanding item.

Technology leveraged / design stack
Microsoft AI Builder OCR; approved enterprise LLM; SharePoint; Excel or Microsoft Lists; Power Automate. SCFHS Mumaris+ and approved verification outputs are authoritative reference inputs, not assumed integrations.

Results / performance measures
Pilot measures: first-review completeness, clarification cycles, outstanding-item ageing and time to credentialing handoff. No completed pilot result claimed.

Differentiation for Health Co
Separate visibility of suitability and readiness. Formal credential verification and professional eligibility remain with authorised bodies.

06 Healthcare Recruitment Funnel & Source-Market Intelligence

Client industry / country
Recruitment analytics portfolio project; healthcare adaptation for KSA and UAE hospital networks.

Client pain point / scope
Application totals conceal the sourcing, interview, offer and mobilisation constraints behind unfilled clinical vacancies.

Our methodology
Standardise candidate identifiers, stages and dates. Use Power Query to consolidate approved exports and surface quality exceptions. Build measures that distinguish sourcing constraints, recruiter delays, panel decisions and external dependencies. Use an LLM to draft commentary from validated aggregate figures. Automate refresh and distribution where supported; review explanations and actions before release.

Technology leveraged / design stack
Excel, Power Query, Power BI and DAX; Microsoft Copilot or ChatGPT for reviewed summaries; Power Automate for scheduled reports and exception notifications.

Results / performance measures
Existing outputs include KPI definitions and dashboard designs. Track time to shortlist, shortlist acceptance, interview conversion, offer acceptance, stage ageing, source yield and offer-to-start conversion.

Differentiation for Health Co
Actionable visibility into which specialties, markets and recruitment stages need intervention, with accountable next steps.

07 AI Recruitment Transformation & 90-Day Pilot Roadmap

Client industry / country
Original fictional 500-person UAE organisation; healthcare design for KSA and UAE.

Client pain point / scope
AI capabilities require clear ownership, adoption and evidence of operational value before wider use.

Our methodology
Map recruitment and baseline effort, conversion and turnaround. Assess existing systems; identify LLM assistance, rules-based automation and handoff improvements. Prioritise by value, feasibility and risk. Design a bounded doctor-and-nurse pilot with owners and acceptance criteria. Compare delivery with the baseline, including checking and correction time. Mobilise, pilot, evaluate and decide whether to expand over 90 days.

Technology leveraged / design stack
Visio or Miro; ChatGPT or Copilot; Excel business cases; Power BI benefits tracking; Power Automate or Make for selected automation prototypes.

Results / performance measures
Existing outputs: transformation blueprint, prioritised use cases and 90-day roadmap. Measure recruiter effort, time to accepted shortlist, rework and candidate progression; deployment savings are not established.

Differentiation for Health Co
An improvement programme built around existing recruitment capability, with expansion based on demonstrated value.

08 Responsible AI & Clinical Shortlist Quality Assurance

Client industry / country
Responsible-AI recruitment framework; healthcare adaptation for KSA and UAE.

Client pain point / scope
AI summaries can introduce unsupported statements, inconsistent scores or inappropriate assumptions.

Our methodology
Define permitted tasks, approved inputs and decision boundaries. Require evidence-linked outputs and explicit missing-information flags. Automate checks for incomplete scorecards and unsupported fields. Test against reviewer-labelled examples, investigate disagreements and retain prompt versions and correction logs. Require recruiter approval and record overrides. Agree access, retention and candidate communication with the responsible client teams.

Technology leveraged / design stack
ChatGPT or Claude; Excel test cases and checks; SharePoint template versioning; Power Automate approval routing; Power BI quality and exception monitoring.

Results / performance measures
Existing output: governance framework. Track unsupported claims, reviewer corrections, scoring consistency, exception resolution and evidence completeness. Human approval is required for every submitted candidate.

Differentiation for Health Co
Quality assurance embedded in shortlist delivery, with a reviewable evidence trail and clear decision accountability.

09 International Nurse & Physician Talent-Pool Development

Client industry / country
Documented [redacted] healthcare work across Middle East and international markets; AI enhancement proposed by HumanEvoX.

Client pain point / scope
Build clinical talent pools ahead of anticipated mandates while coordinating research without duplicate effort.

Our methodology
Historical work defined role families and geographies, briefed delivery-centre researchers and coordinated pools. The proposed AI enhancement standardises taxonomies and search strings through an LLM. Power Query consolidates records and flags duplicates; workflow automation assigns reviews and profile-refresh tasks. Recruiters verify relevance and candidate interest.

Technology leveraged / design stack
Historical: professional-profile research, shared Excel trackers and delivery-centre coordination.
Proposed: ChatGPT or Copilot, LinkedIn Recruiter, Excel, Power Query and Power Automate.

Results / performance measures
Emails record approval for 2-3 Manila resources and a clinical tracker covering Middle East, Southeast Asia and Europe. These are documented scope measures. Evaluate AI through productivity, duplicate rate, completeness and qualified-pool conversion.

Differentiation for Health Co
International clinical research coordination reinforced by a repeatable approach to talent-pool quality and maintenance.

10 International Specialist Physician Mapping & Search Calibration

Client industry / country
Documented [redacted] hospital recruitment requirement, India; international source markets. AI enhancement proposed.

Client pain point / scope
Identify physicians for specialist leadership requirements and align international research with specialty and experience expectations.

Our methodology
Historical work calibrated specialties, coordinated research and gathered feedback on a shared tracker. The AI enhancement expands specialty terminology, structures career evidence and drafts comparison briefs. Recruiter review distinguishes relevant practice from academic or adjacent experience. Automate tracker consolidation and coverage reporting to identify search gaps.

Technology leveraged / design stack
Historical: LinkedIn-profile research and Excel trackers. Proposed: ChatGPT or Claude, LinkedIn Recruiter, Excel, Power Query, Power BI and Power Automate.

Results / performance measures
Documented scope: five specialties and four mapping markets - UK, Singapore, Australia and Canada - with a tracker shared for review. Evaluate relevant-profile yield, reviewer acceptance and research time per qualified profile; no placement total claimed.

Differentiation for Health Co
Specialty-level search calibration combining international healthcare experience with transparent candidate evidence.

11 Healthcare Recruitment Discovery & International Campaign Planning

Client industry / country
Documented [redacted] discovery: government healthcare, KSA, and hospital healthcare, UAE. AI enhancement proposed.

Client pain point / scope
Translate doctor and nurse demand into international campaigns with sourcing priorities, interview capacity and clear responsibilities.

Our methodology
Historical work covered stakeholder discovery, clinical requirements, source markets and recruitment constraints. The AI enhancement turns approved notes into demand matrices and campaign plans. LLMs draft role briefs, candidate communications and management updates. Automate status consolidation, scheduling reminders and action tracking. Model pipeline scenarios using observed conversion rates when available, with assumptions visible.

Technology leveraged / design stack
Historical: discovery briefs, process analysis and trackers. Proposed: Microsoft Teams, ChatGPT or Copilot, Excel, Microsoft Forms, Power Automate and Power BI.

Results / performance measures
KSA notes record a planned 100-physician interview campaign; UAE discovery identified five operating areas. These are planning measures. Track attendance, qualified-candidate coverage, panel utilisation, decision turnaround and offer conversion.

Differentiation for Health Co
International sourcing plans aligned with interview-panel capacity and internal decision-making requirements.
